

SCIENTIFIC TECHNICAL SERVICES

GfE Fremat GmbH Diagnostics Services

METALLOGRAPHY

Sample preparation

- abrasive cutting machinery
- cold, warm and UV embedding
- grinding and polishing using a semi-automatic preparation technique
- material-specific microstructural contrasting/etching (chemical)

Our preparation has the aim of achieving the best possible quality including a high rate of reproducibility and the efficient utilization of time and materials.

Evaluation and documentation

Light microscopy with modern image archiving

- digital camera (macro photography)
- stereomicroscopy
- light microscopy
bright field, dark field, polarized light, fluorescence contrast, differential interference contrast
- reporting in digital and paper form
- determination of coating thickness*
- grain size analysis*
- corrosion tests*
- client support and consultation by the responsible employee or a team of experienced company staff

* in accredited field

Quantitative Metallography

- analysis software
Grain size analysis of single and multiphase materials.
Analysis of phase fractions and porosities etc.

MICROANALYSIS

Scanning electron microscopy

- investigations of surfaces and micro-sections by means of high magnification
- elemental scanning maps
- linescans
- energy dispersive analysis (EDX)

Microprobe with wavelength dispersive (WDX) and energy dispersive analysis (EDX)

- element determination by means of high resolution
- elemental scanning maps
- linescans

MATERIAL TESTING

- hardness measurements based on various methods (HV*, HB*, HM, HRC)
- tensile* and pressure tests
- adhesion tests*
- heat treatment in laboratory annealing systems with temperature regulation and monitoring
- roughness measurement for the determination of surface characteristics

* in accredited field

PHYSICAL EXAMINATIONS

In the physical laboratory spray powders, sprayed layers and other materials are characterized by different methods:

- laser diffraction (wet/dry)
- density determination (bulk, tapped or hydrostatic density)
- flowability
- dilatometric measurements up to 1600 °C
